# Evaluating Lexical Similarity to Build Sentiment Analysis

Annotated Data

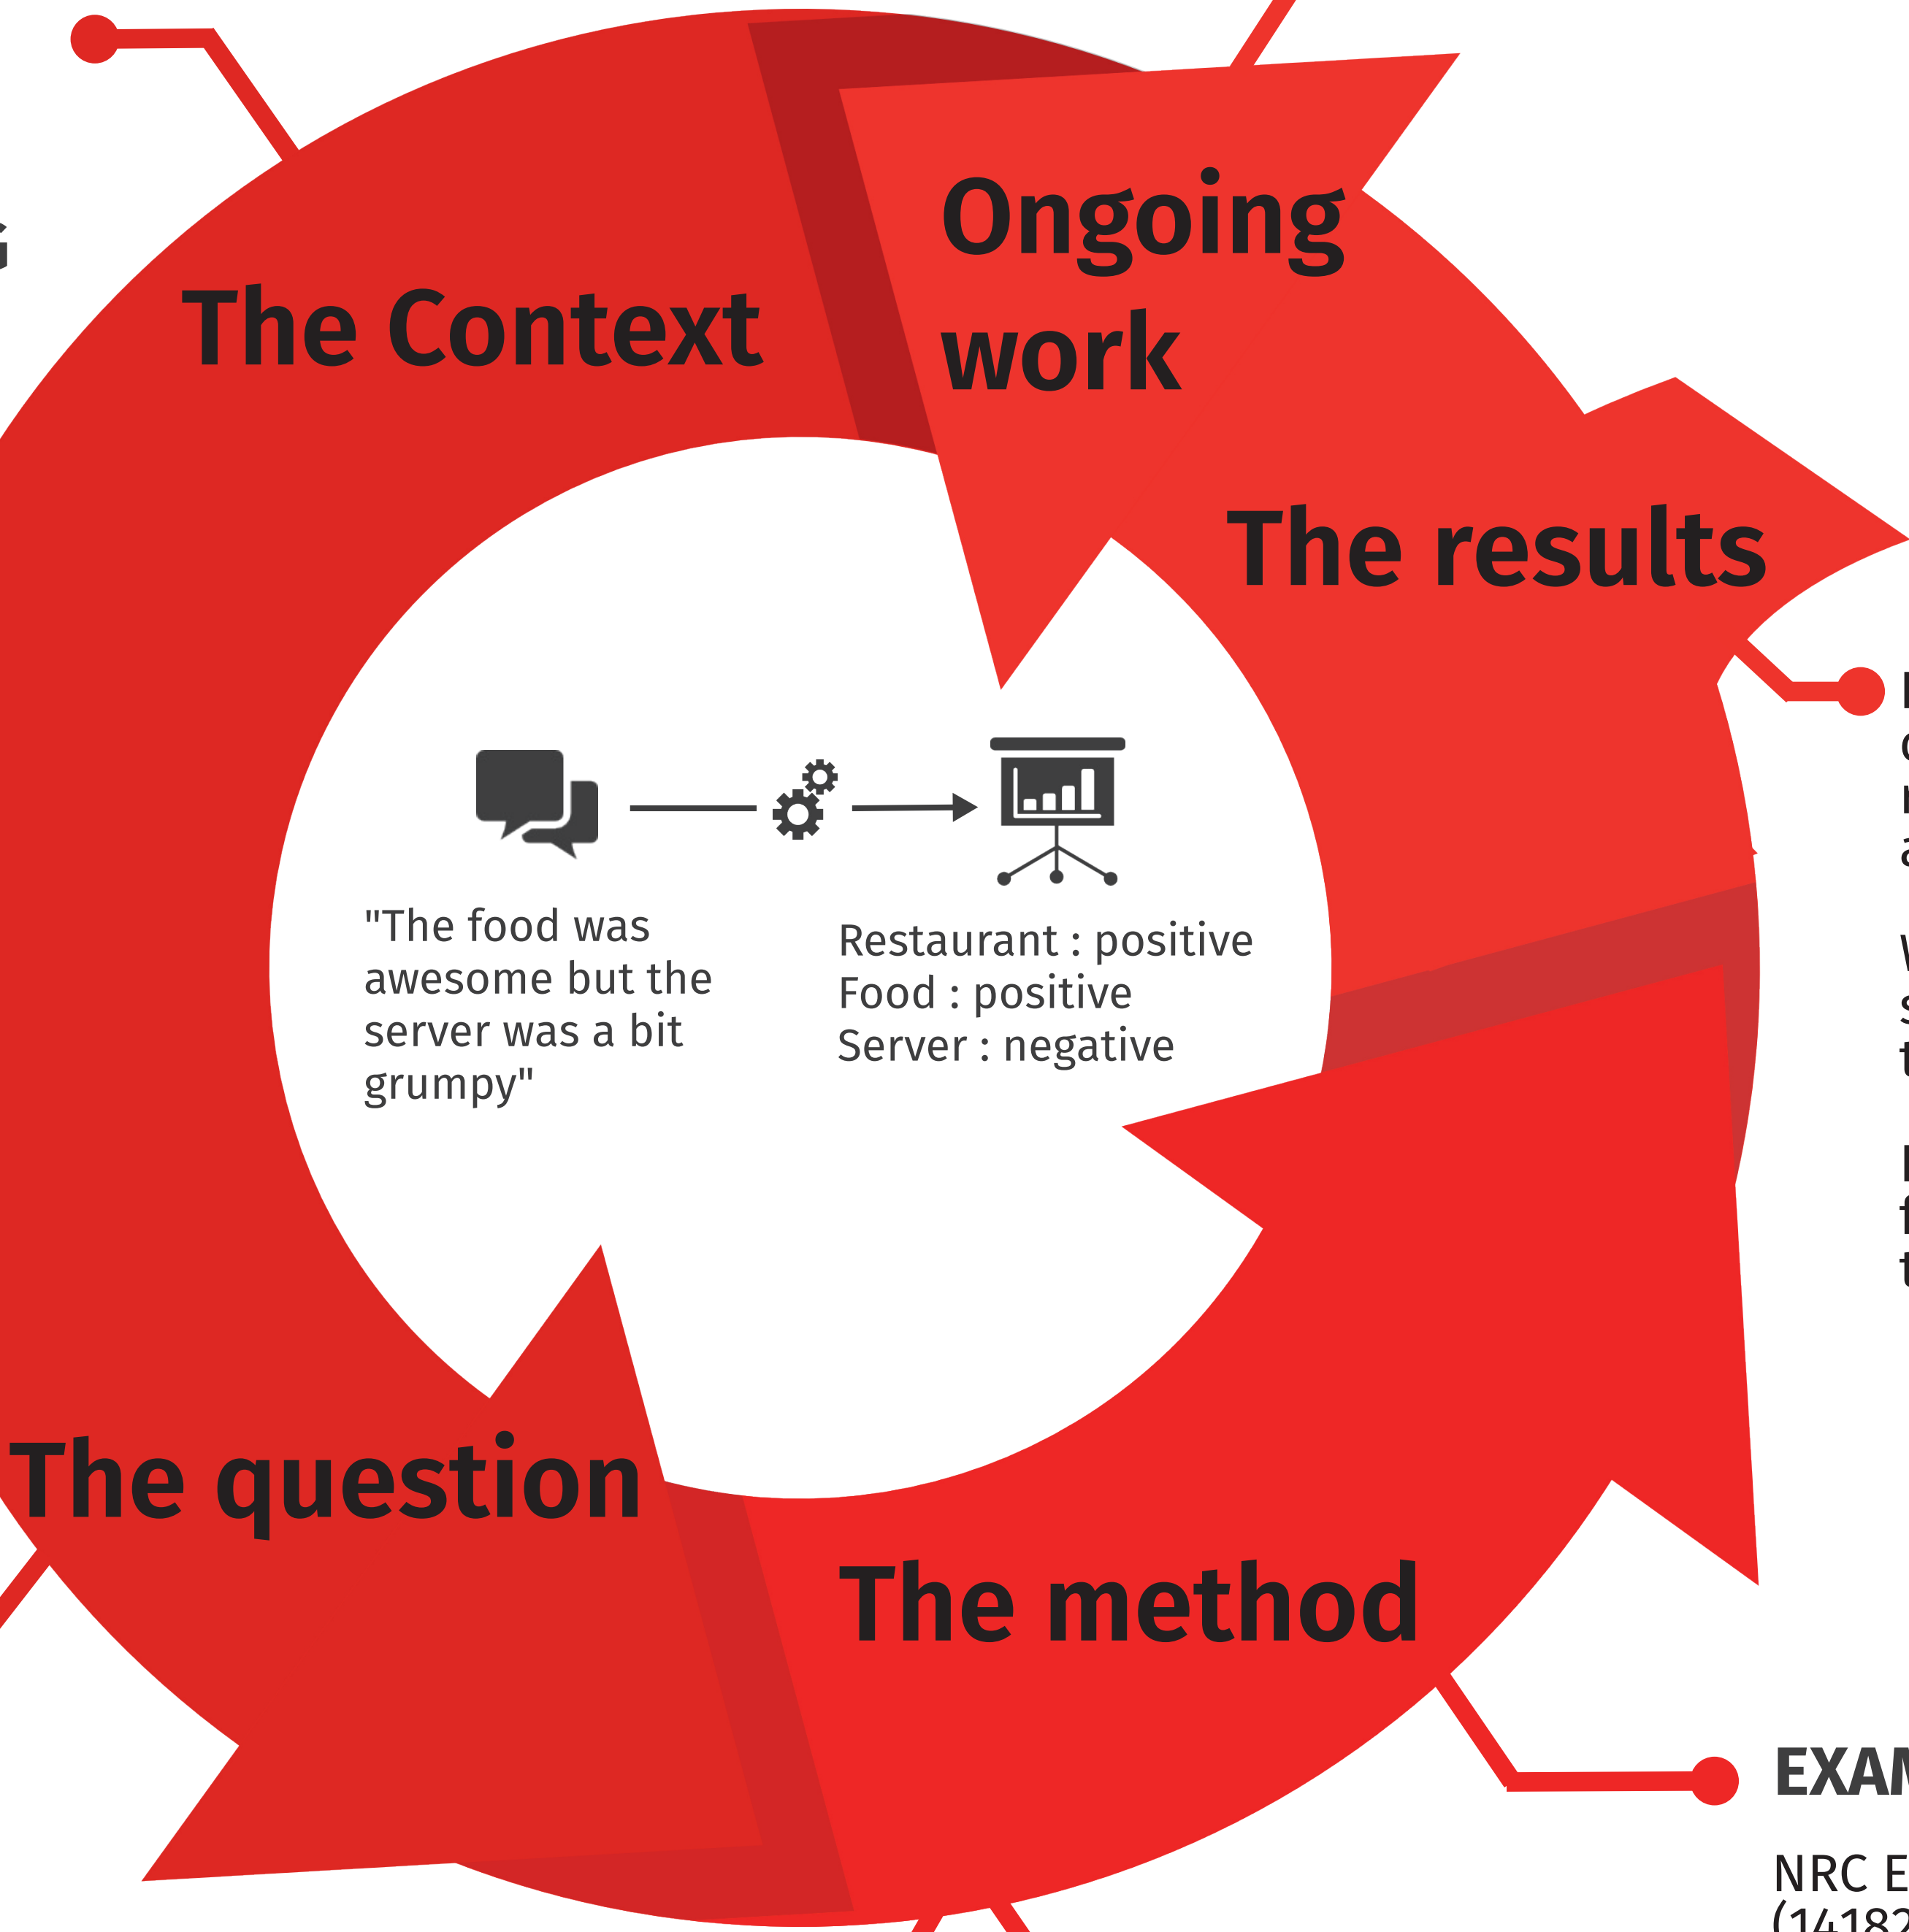

Resources

**MACHINE LEARNING MODEL**  
(SVM, Neural Network...)

- Lexicons
- Clusters
- Distributional thesaurus
- Vector Space Models

Use analogy solving capabilities of word representations to address the issue encountered with distance measure

## HOW TO EVALUATE RESSOURCES ?

- The classical way : Train a machine learning model and evaluate its performance
- Our way : Evaluate resources against manually built lexicons

## PROCESS

1. Generate a reference list from reference lexicons
2. Try to reproduce the list with the word representations
3. Compare the predicted list with the reference list

## LEXICONS USED

- ANEW : 3 real valued dimensions
- SentiWordNet : 3 relad valued dimensions
- NRC Emotion Lexicon : 8 binary dimensions

	Abandon	Happy	Weekly
Anger	X	X	X
Anticipation	X	✓	X
Disgust	X	X	X
Fear	✓	X	X
Joy	X	✓	X
Sadness	✓	X	X
Surprise	X	X	X
Trust	X	✓	X

## EXAMPLE

NRC Emotion Lexicon (14182 words)
